

## **Dulux Duratec® and Electro™ powder coats: extra information**

Duratec® is now available in 33 colours held in stock in New Zealand. Duratec® may also be made to order in a wide range of colours, with most of the Duralloy® colours featured in the Duralloy® colour guide able to be formulated in Duratec® and manufactured for a specific project. Note: specific non- stock colours made in Duratec to order require the manufacture of minimum volumes and are thus more suited to the larger projects.

Standard Duratec colours are normally designed for larger projects. However there is no problem in using Duratec standard colours on smaller jobs in exterior situations for better performance; for example in more aggressive or exposed locations providing there is allowance for any extra costs involved. Duratec® exceeds the international AAMA 2604 specification with an expected performance of 20 years film integrity and up to 15 years colour integrity.

Dulux have now introduced the Bright Colour Intensity range to their stock Duratec® colours. This range is becoming increasingly popular for contrast trims, in hospitals and schools, where bright colours enhance the environment. While the Duratec Bright Colour range is a more expensive product, it is still economical and does allow for durable high performance bright colours in exterior locations.
